This is a very simple app which is not complex at all, you can try it for free. If you enjoyed this review, I would be happy to share this with your friends. You can click the button below to share this article with your friends, or you can leave them a comment. Let me know what you think!

Q: jQuery - updating an attribute value I have some objects that each have an "attribute" - name of course. Each object also has a "value" property that holds the data from a database. I want to be able to update this value and set it on the object. My question is, how do I call the setAttribute method? I have tried: `$("#t").setAttribute('myattribute', data);` but all it does is overwrite the value. A: From the docs: The second parameter can be either a string of HTML attributes to set on the matched elements, or an object containing key/value pairs of attributes to set. Your string of attributes is probably not valid. If you want to set an attribute in the DOM, you'll have to do: `$("#t").attr('myattribute', data);` which is a common jQuery function that will perform the same operation as the setAttribute() method in the DOM.

Q: How can I use the JDBC driver in Spring MVC with Hibernate? I have a web application built with Spring MVC, Hibernate, Tomcat, etc. I need to use the MySQL 5.0 driver to connect to the database. The problem is that the Spring MVC project uses Hibernate to handle the data access, and Hibernate requires an older version of the driver (4.1.5). How can I use the 5.0 driver in a Spring MVC context? In spring.xml just add: 82157476af
